Trading Board on Matching Engine	605

HOW DOES THE FUTURE CONTRACT WORK

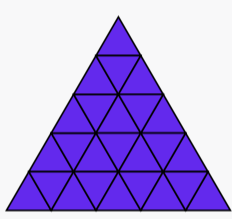

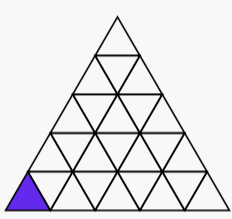

Oil futures allow you to gain exposure and benefit from the increase and decrease in oil prices.

1. Buy or sell?

Micro Oman Crude Oil (OMOIL) PRICE TODAY -\$110	What do you think will happen to the price? I think the oil price will go Down ▼ <hr style="border: 1px solid red;"/> You will Sell	I think the oil price will go Up ▲ <hr style="border: 1px solid green;"/> You will Buy
--	---	---

2. What's the Margin or Leverage?

Leverage magnifies the size of any profits or losses as investors only pay a small amount upfront called initial margin. This allows investors to maximize their portfolio size and return, but can also lead to higher losses.

BUYING OIL BARREL <div style="border: 1px solid #ccc; padding: 5px; display: inline-block;">BUY</div> \$10,000 worth of Oil barrel <div style="border: 1px solid #ccc; padding: 5px; display: inline-block;">PAY</div> \$10,000 at the time of purchasing  Pay in full amount The impact of leverage: If your return is \$1000 and bought Oil barrels and paid \$10,000 your rate of return would be $\$1000/\$10,000 = 10\%$	BUYING OIL FUTURES <div style="border: 1px solid #ccc; padding: 5px; display: inline-block;">BUY</div> \$10,000 worth of Oil futures <div style="border: 1px solid #ccc; padding: 5px; display: inline-block;">PAY</div> 10-15% of the value  Pay initial margin only The impact of leverage: If your return is \$1000 and bought Oil futures and paid \$1,500 (15% of \$10,000) your rate of return would be $\$1000/\$1,500 = 66\%$
---	---

3. How is the profit calculated?

Let's imagine that per barrel oil price goes from

-\$110 > **\$100** ▼

1 Contract = 100 Barrels

SCENARIO 1 If you expected the price to go down and went short (sold a contract) you would have made a profit Original value $\$110 \times 100 \text{ Barrels} = \$11,000$ New value $\$100 \times 100 \text{ Barrels} = \$10,000$ Your profit is the difference in value <div style="background-color: green; color: white; padding: 5px; display: inline-block;">\$1000</div>	SCENARIO 2 If you expected the price to go up and went long (bought a contract) you would have made a loss Original value $\$110 \times 100 \text{ Barrels} = \$11,000$ New value $\$100 \times 100 \text{ Barrels} = \$10,000$ Your loss is the difference in value <div style="background-color: red; color: white; padding: 5px; display: inline-block;">\$1000</div>
